# Mutating Joins Week 7

Credit Daniel Anderson for slides

## **Agenda**

- bind\_rows()
- \*\_join()

#### **Overall Purpose**

- Understand and be able to identify keys
- Understand different types of mutating joins
  - o left\_join
  - o right\_join
  - one-to-one
  - one-to-many
- Understand some ways joins fail

## A bit about joins

- Also data "merge"
- Today we'll talk about mutating joins
- Mutating joins add columns to a dataset
- Mutating joins are the most common, but filtering joins can be very powerful

#### What if I want to add rows?

Not technically a join (no key involved)

## **Binding rows**

```
g3
                           g4
## # A tibble: 3 x 3
                           ## # A tibble: 3 x 3
## sid grade score
                           ##
                                sid grade score
## <int> <dbl> <int>
                          ## <int> <dbl> <int>
## 1
           3 210
                   ## 1 9
                                      4 201
## 2 2 3 191
## 3 3 198
                          ## 2 10 4 189
排 3 3
                          ## 3 11 4 187
```

# bind\_rows()

- In examples like the previous data sets, we just want to combine the data by stacking the rows
- Data have same (or approximately same) columns
- We can do so with bind\_rows()

```
bind_rows(g3, g4)
```

```
## # A tibble: 6 x 3
      sid grade score
###
    <int> <dbl> <int>
###
## 1
              3
                  210
## 2
                  191
## 3
                  198
## 4
                  201
              4
## 5
       10
              4 189
## 6
       11
           4
                  187
```

# dplyr::bind\_rows()

an efficient way to bind many data frames into one, by stacking rows
 can bind multiple datasets

```
one <- mtcars[1:4, ]
two <- mtcars[6:10, ]
three <- mtcars[12:14, ]
bind_rows(one, two, three)</pre>
```

- like joining (merging) data frames that have the same columns
- columns don't need to match when row-binding

## Optional . id argument

- What if we knew the grade, but didn't have a variable in each dataset already?
- Use .id to add an index for each dataset

```
bind_rows(select(g3, -grade), select(g4, -grade), .id = "dataset")
```

```
## # A tibble: 6 x 3
## dataset sid score
## <chr> <int> <int>
## 1 1
               1
                   210
## 2 1
               2 191
               3 198
## 3 1
## 4 2
                   201
## 5 2
                   189
              10
## 6 2
               11
                   187
```

## Recode .id column

```
bind_rows(select(g3, -grade), select(g4, -grade), .id = "dataset") %>%
  mutate(grade = ifelse(dataset == 1, 3, 4))
```

```
## # A tibble: 6 x 4
## dataset sid score grade
## <chr> <int> <int> <dbl>
## 1 1
             1
                 210
## 2 1
             2 191
## 3 1
             3 198
                 201
## 4 2
            10 189 4
排 5 2
             11 187
## 6 2
```

### **Even better**

```
bind_rows(select(g3, -grade), select(g4, -grade), .id = "grade") %>%
  mutate(grade = ifelse(grade == 1, 3, 4))
```

```
## # A tibble: 6 x 3
## grade sid score
## <dbl> <int> <int>
## 1
           1
              210
## 2 3
           2 191
## 3 3
           3 198
## 4 4
         9
              201
## 5 4 10 189
## 6 4 11
              187
```

#### What if columns don't match exactly?

#### Pads with NA

```
bind_rows(g3, g4[ ,-2], .id = "dataset")
## # A tibble: 6 x 4
## dataset sid grade score
## <chr> <int> <dbl> <int>
                     3 210
## 1 1
## 2 1
                     3 191
## 3 1
                     3 198
## 4 2
               9
                    NA 201
                    NA 189
## 5 2
              10
## 6 2
              11
                    NA 187
```

## You can also bind\_cols()

```
math
read
## # A tibble: 3 x 2
                              ## # A tibble: 3 x 1
      sid read
##F
                              4£4£
                                    math
## <int> <int>
                              ## <int>
## 1
        1 210
                              ## 1
                                     202
排 2 2 223
                              ## 2 197
## 3 3
          200
                              ## 3 217
```

# bind\_cols()

```
bind_cols(read, math)
```

```
## # A tibble: 3 x 3
## sid read math
## <int> <int> <int> 210 202
## 2 2 223 197
## 3 3 200 217
```

# **Joins**

(not to be confused with row binding)

## **Keys**

- Uniquely identify rows in a dataset
- Variable(s) in common between two datasets to be joined
- A key can be more than one variable

#### Types of keys

- Small distinction that you probably won't have to worry about much, but is worth mentioning:
  - **Primary keys**: uniquely identify observations in *their* dataset
  - Foreign keys: uniquely identify observations in other datasets

## What's the primary key here?

First, let's break down the code:

```
## # A tibble: 984 x 33
     child id teache~1 schoo~2 k type schoo~3 sex ethnic famtype numsibs SE
##F
              <chr>
                       <chr>
##F
     <chr>

# **Mutating joins**

# Mutating \*\_joins()

- In {tidyverse}, we use mutate() to create new variables within a dataset
- A mutating join works similarly, in that we're adding new variables to the existing dataset through a join
- Join: Two tables of data joined by a common key

## Four types of joins

- left\_join: keep all the data in the left dataset, drop any non-matching cases from the right dataset
- right\_join: keep all the data in the right dataset, drop any non-matching cases from the left dataset

- inner\_join: keep only data that matches in both datasets
- full\_join: keep all the data in both datasets (also sometimes referred to as an outer join)

## Four types of joins

#### **Mutating joins**

- left\_join: keep all the data in the left dataset, drop any non-matching cases from the right dataset
- right\_join: keep all the data in the right dataset, drop any non-matching cases from the left dataset

#### **Filtering joins**

- inner\_join: keep only data that matches in both datasets
- full\_join: keep all the data in both datasets (also sometimes referred to as an outer join)

## Four types of joins

#### **Mutating joins**

- left\_join: keep all the data in the left dataset, drop any non-matching cases from the right dataset
- right\_join: keep all the data in the right dataset, drop any non-matching cases from the left dataset

#### **Filtering joins**

- inner\_join: keep only data that matches in both datasets
- full\_join: keep all the data in both datasets (also sometimes referred to as an outer join)

## Using joins to recode

Say you have a dataset like this

```
## # A tibble: 6 x 3
## sid dis_code score
## <int> <int> <int> <int> 
## 1 1 74 190
## 2 2 40 200
## 3 3 60 200
## 4 4 00 183
## 5 5 10 210
## 6 6 96 188
```

#### Codes

Code	Disability
0	'Not Applicable'
10	'Intellectual Disability'
20	'Hearing Impairment'
40	'Visual Impairment'
43	'Deaf-Blindness'
50	'Communication Disorder'
60	'Emotional Disturbance'
70	'Orthopedic Impairment'
74	'Traumatic Brain Injury'
80	'Other Health Impairments'
82	'Autism Spectrum Disorder'
90	'Specific Learning Disability'
96	'Developmental Delay 0-2yr'
98	'Developmental Delay 3-4yr'

## Recode method

Using case\_when()

```
dis_tbl %>%
  mutate(disability = case_when(
    dis_code == "10" ~ "Intellectual Disability",
    dis_code == "20" ~ 'Hearing Impairment',
    ...,
    TRUE ~ "Not Applicable"
    )
)
```

## Join method

```
dis code tbl <- tibble(</pre>
  dis code = c(
    "00", "10", "20", "40", "43", "50", "60",
    "70", "74", "80", "82", "90", "96", "98"
    ),
  disability = c(
    'Not Applicable', 'Intellectual Disability',
    'Hearing Impairment', 'Visual Impairment',
    'Deaf-Blindness', 'Communication Disorder',
    'Emotional Disturbance', 'Orthopedic Impairment',
    'Traumatic Brain Injury', 'Other Health Impairments',
    'Autism Spectrum Disorder', 'Specific Learning Disability',
    'Developmental Delay 0-2yr', 'Developmental Delay 3-4yr'
```

#### dis\_code\_tbl

```
## # A tibble: 14 x 2
      dis code disability

## Imperfect key match?

# Consider the following

```
frl <- tibble(key = 1:3, frl = rbinom(3, 1, .5))
sped <- tibble(key = c(1, 2, 4), sped = rbinom(3, 1, .5))</pre>
```

```
frl
```

```
## # A tibble: 3 x 2
## key frl
## <int> <int>
## 1 1 0
## 2 2 1
## 3 3 0
```

```
sped
```

```
## # A tibble: 3 x 2
## key sped
## <dbl> <int>
## 1 1 0
## 2 2 1
## 3 4 0
```

# Consider the following

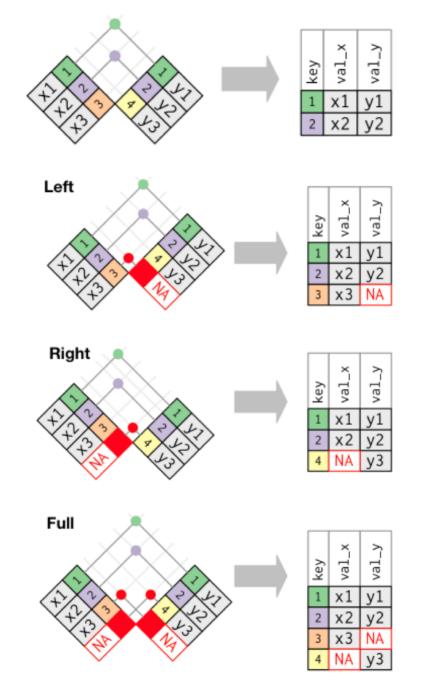

### left\_join()?

```
left_join(frl, sped)
```

```
## # A tibble: 3 x 3
## key frl sped
## <dbl> <int> <int>
## 1 1 0 0
## 2 2 1 1
## 3 3 0 NA
```

### right\_join()?

```
right_join(frl, sped)
```

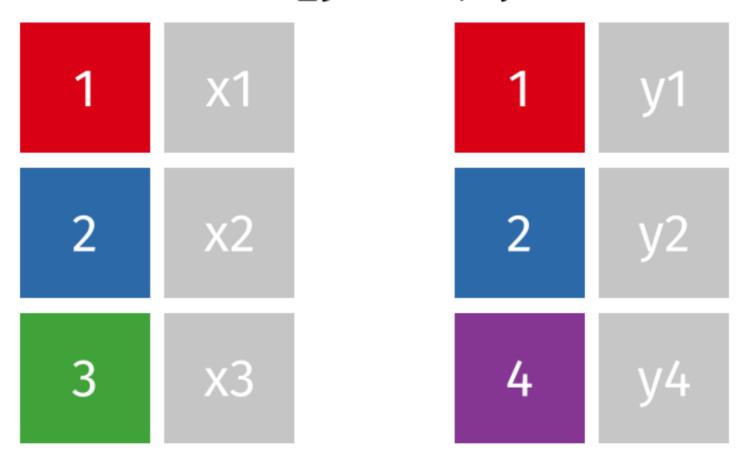

From r4ds

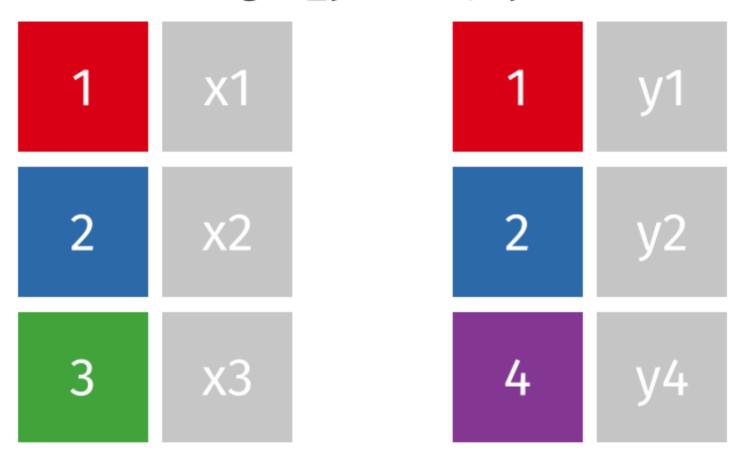

## **Animations**

All of the following animations were created by Garrick Aden-Buie and can be found here

### left\_join(x, y)

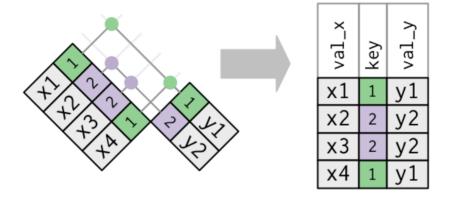

### right\_join(x, y)

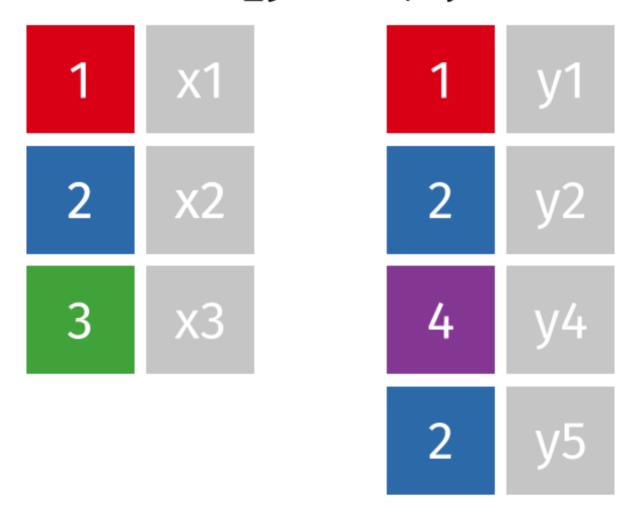

### What if the key is not unique?

- Not an issue, as long as they are unique in one of the tables
  - In this case, it's called a one-to-many join

We saw this when we joined disability code with disability

### left\_join(x, y)

### **Example**

### Student-level data

```
(stu <- tibble(
   sid = 1:9,
   scid = c(1, 1, 1, 1, 2, 2, 3, 3
   score = c(10, 12, 15, 8, 9, 11)</pre>
```

```
## # A tibble: 9 x 3
      sid scid score
###

## # ... with 17 more rows
```

### How do we fix this?

In some cases, the solution is obvious, in others it is not

### In this case

Move the dataset to wide before joining

### Move to wide

We will cover this in Week 8

### Join

### One to many join

```
left_join(stu, seasonal_means_wide)
```

```
## # A tibble: 9 x 6
       sid scid score fall winter spring
##
     <int> <dbl> <dbl> <dbl> <dbl> <dbl>
##
## 1
                    10 0.345 1.54 -0.330

### Default join behavior

## # time hour <dttm>

By default, the \_join functions will use all columns with common names as keys

```
flights2 <- flights %>%
  select(year:day, hour, origin, dest, tailnum, carrier)
flights2[1:2, ]
## # A tibble: 2 x 8
## year month day hour origin dest tailnum carrier
## <int> <int> <dbl> <chr> <chr>

                                 24.9
                                                   13028.
```

# **Next time**

### **Before next class**

- Homework
  - Homework 8
- Reading
  - R4DS 12
  - Wickham, H. (2014). Tidy Data.
  - R-Ladies Sydney. CleanItUp 5

## **Homework 8**

# **Final Project**

# **Final Project**

Final paper: R Markdown document

### Final project must:

- Be fully reproducible
  - This implies the data are open
- Be a collaborative project hosted on GitHub
- Move data from its raw "messy" format to a tidy data format
- Include at least two exploratory plots
- Include at least summary statistics of the data in tables, although fitted models are also encouraged

# **Final Project - Dates**

- Week 9 (11/23): Data prep script due
- Week 10 (11/30): Peer review due
- Week 10 (11/30): Final project presentations
- Week 11 (12/7): Final Paper due

### Final Project - Data Prep Script

- Expected to be a work in progress
- Provided to your peers so they can learn from you as much as you can learn from their feedback

### **Peer Review**

- Understand the purpose of the exercise
- Conducted as a professional product
- Should be very encouraging
- Zero tolerance policy for inappropriate comments

# Final Project - Presentation

Groups are expected to present for approximately 15 minutes (split evenly among members). Group order randomly assigned.

### Presentation cover the following:

- Share your journey (everyone, at least for a minute or two)
- Discuss challenges you had along the way
- Celebrate your successes
- · Discuss challenges you are still facing
- Discuss substantive findings
- Show off your cool figures!
- Discuss next R hurdle you want to address

# Final Project - Presentation Scoring Rubric

### **Final Presentation Rubric**

Criteria	Points possible
Challenges faced along the way	5
Victories and things to celebrate	5
Challenges you are still facing	5
Substantive findings/interpretations	5
Next R hurdle to tackle	5
Total	25

# Final Project - Paper

- R Markdown document
  - Abstract, Intro, Methods, Results, Discussion, References
  - Should be brief: 3,500 words max
- No code displayed should look similar to a manuscript being submitted for publication
- Include at least 1 table
- Include at least 2 plots
- Should be fully open, reproducible, and housed on GitHub
  - I should be able to clone your repository, open the R Studio Project, and reproduce the full manuscript (by knitting the R Markdown doc)

## **Final Paper - Scoring Rubric**

Criteria	Points Possible
Writing	
Abstract	5
Introduction	5
Methods	5
Results	5
Discussion	5
References	5
Code	
Document is fully reproducible	25
Demonstrate use of inline code	5
At least two data visualizations	10 (5 pts each)
Demonstrate tidying messy data using:	
pivot_longer()	5
mutate()	5
select() and filter()	5
pivot_wider()	5

# **Final Project**

### The following functions:

- pivot\_longer()
- mutate()
- select()
- filter()
- pivot\_wider()
- group\_by()
- summarize()
